

Remote Sensing and GIS

11/4/2014 Geo327G/386G, U Texas, Austin 1

Definitions and Considerations

- Remotely sensed data - acquired without physical contact
 - Photographs and related data acquired by aircraft or satellite
 - Spectroscopy/Spectrometry
 - Principle advantages
 - Unbiased (nonselective) sampling
 - Rapid acquisition
 - Large footprints, synoptic bird's eye view
 - Acquisition of data spanning non-visible portion of the em spectrum; multispectral, multi-scale

11/4/2014 Geo327G/386G, U Texas, Austin 2

Definitions and Considerations

- Photograph - conventional picture by camera in the visible region of the em spectrum; analog
- Image, imagery - acquired by electronic detectors in the visible and/or nonvisible portion of the spectrum; digital

11/4/2014 Geo327G/386G, U Texas, Austin 3

Principle Land Mapping Applications

- Land Use/Land Cover, especially change over time- (categorical data)
- Planimetric location (x, y)
- Topographic/bathymetric elevation (x, y, z)
- Color and spectral signature
 - Vegetation biomass, chlorophyll absorption characteristics, moisture content
 - Soil moisture content
 - Temperature
 - Composition (spectrometry)
- Texture/Surface roughness

11/4/2014 Geo327G/386G, U Texas, Austin 4

Principles

- Gather reflected, emitted or backscattered radiation

11/4/2014 Geo327G/386G, U Texas, Austin 5

Remote Sensing Classifications

- Passive - either analog or digital radiation *samplers*, e.g. cameras, TIR detectors, multispectral scanners
- Active - send out signal and record reflected radiation, e.g. imaging radar, synthetic aperture radar (SAR)
- Aerial platforms - e.g. aerial photography; large scale (<1:25,000)
- Space platforms - space station or satellite, e.g. SIR, Landsat; small scale (>1:750,000)

11/4/2014 Geo327G/386G, U Texas, Austin 6

Atmospheric attenuation and scattering

- Scattering strongest at short wavelengths (blue sky: u.v. & blue scattered more strongly than rest of visible)
- Ozone absorbs x-rays & u.v., clouds scatter and absorb visible and I.R., except in certain windows, e.g. TIR
- Windows for radar and microwaves at 1mm - 1 m λ

11/4/2014 Geo327G/386G, U Texas, Austin 7

Interactions at the surface

- Reflection, absorption (±refraction & transmission)
 - Absorbed energy re-emitted at longer wavelengths (e.g. thermal I.R.)
 - Reflection characteristics depend upon:
 - surface roughness (diffused and brighter for rough vs. mirror-like and dark for smooth)
 - amount of absorption \approx composition of material
 - Result is a complex "Tonal Signature"

11/4/2014 Geo327G/386G, U Texas, Austin 8

Resolution Characteristics

- Four basics aspects of resolution:
 - Spatial 
 - Spectral 
 - Radiometric 
 - Temporal 

11/4/2014 Geo327G/386G, U Texas, Austin 9

Spatial Resolution

- Spatial detail; sharpness of an image
 - Analog resolution:
 - Factor of resolving power of lens & film
 - Calibrate with line pair target. Best obtainable is ~ 60 line pairs/mm
 - Ground Resolution = scale factor/width of minimum resolved line

E.g. For photo at scale of 1:10,000 and 60 lp/mm

$$GR = 10,000/60 = 17 \text{ cm}$$

11/4/2014 Geo327G/386G, U Texas, Austin 10

Spatial Resolution

- Digital Image resolution
 - Function of detector characteristics (summarized by instantaneous field of view; IFOV) and height
 - Raster resolution (e.g. meters/pixel) is proxy for resolution, though at least 2 pixels are required to derive same content as analog image
 - Number of pixels required to achieve same resolution as best 9" x 9" analog aerial photo is ~700 megapixels! (c.f. "retina display" of ~8.6 Mpixels)

11/4/2014 Geo327G/386G, U Texas, Austin 11

Spatial Resolution Comparisons

10 meter resolution

5 meter resolution

15

High Spatial Resolution Satellites

- **Quickbird-2** (DigitalGlobe)
 - -0.5m panchromatic, -0.5m multispectral
- **IKONOS-2** (Space Imaging, "GeoEye")
 - 1m panchromatic, 4m multispectral (4 bands)
- **SPOT** (French Commercial Satellite)
 - 2.5m panchromatic
- **Landsat 7 ETM+ & 8** (NASA/USGS)
 - 15m panchromatic, 30m multispectral
- EOS Terra **ASTER** radiometer (NASA)
 - 15m in three visible to near-IR bands

11/4/2014
Geo327G/386G, U Texas, Austin
16

Spectral Resolution

- Wavelength(s) to which the detector is sensitive. Depends upon:
 - Number of wavelength bands (channels)
 - Width of each band
- Low spectral res. - Panchromatic photograph; one wide band (-0.4-0.7 μ m)
- High spectral res. = narrow bandwidth for many bands
 - e.g. EOS-Terra ASTER
 - 14 narrow bands that span visible to TIR (0.5-12 μ m)

11/4/2014 Geo327G/386G, U Texas, Austin 17

“Hyperspectral” Resolution

- = Very high spectral resolution
 - EOS-Terra and Aqua **MODIS**
 - 21 bands within UV to near IR, 15 bands within TIR, all with narrow bandwidths
 - Simultaneously observe cloud cover, sea and land temps., land cover, vegetation properties
 - EOS-Terra **ASTER**
 - 14 narrow bands that span visible to TIR
 - JPL **AVIRIS**
 - 224(!) narrow bands at 20-m spatial resolution from high altitude NASA aircraft

11/4/2014 Geo327G/386G, U Texas, Austin 18

Aqua/MODIS

11/4/2014 Geo327G/386G, U Texas, Austin 19

Spectral Resolution: ASTER, Landsat 7 ETM+ and 8

Sensor	Spatial Resolution (m)	Spectral Resolution (μ m)	Band Count
ASTER	15m	0.4 - 0.7	1
		0.7 - 1.2	2
	30m	1.6 - 2.4	4
		2.4 - 12	10
90m	8 - 12	11, 12	
	10 - 12	13, 14	
Landsat 7 ETM+	15m	0.4 - 0.7	1
	30m	0.7 - 1.2	2, 3, 4
Landsat 8	15m	0.4 - 0.7	1
	30m	0.7 - 1.2	2, 3, 4
Landsat 8	100m	8 - 12	10
		10 - 12	11

11/4/2014 Geo327G/386G, U Texas, Austin 20

Why high spectral resolution?

- Spectral reflectance is a sensitive indicator geology, water content, vegetation type, etc.
- Applications in ecology, geology, snow&ice hydrology, atmospheric sciences, coastal and inland waterway studies, hazards assessment

11/4/2014 Geo327G/386G, U Texas, Austin 21

Example: Aster TIR Band Image

June 4, 2001 thermal image of Shiveluch volcano on Kamchatka Peninsula.

A lava dome is the hot spot visible on the summit of the volcano. The second hot area is either a debris avalanche or hot ash deposit.

An ash plume is seen as a cold “cloud” streaming from the summit.

NASA/GSFC/MITI/ERSDAC/JAROS
U.S./Japan ASTER Science Team

11/4/2014 Geo327G/386G, U Texas, Austin 22

Example: Aster VNIR Band Image

Saudi Arabia sand dunes, 6-25-02

Depicts linear dunes in Rub' Al Khali or Empty Quarter in Saudi Arabia.

Dunes are yellow due to iron oxide minerals; inter-dune areas are made up of clays and silt and appears blue due to high reflectance in Band 1

NASA/GSFC/MITI/ERSDAC/JAROS
U.S./Japan ASTER Science Team

11/4/2014 Geo327G/386G, U Texas, Austin 23

Example: Aster Band Image

Lake Garda, Italy - June 29, 2000

Lake Garda lies in the provinces of Verona, Brescia, and Trento. It is 51 km long and 3 to 18 km wide.

The image on the right was the contrast stretched to display variations in sediment load

NASA/GSFC/MITI/ERSDAC/JAROS
U.S./Japan ASTER Science Team

11/4/2014 Geo327G/386G, U Texas, Austin 24

Aster Multi-band Band Images

Saline Valley, California

- VNIR (3,2,1) - vegetation appears red, snow and dry salt lakes are white, exposed rocks are brown, gray, yellow, and blue
- SWIR (4,6,8) - clay, carbonate, and sulfate minerals result in distinctive colors; limestones are yellow-green and kaolinite rich areas are purple
- TIR (13,12,10) - variations in quartz content are shades of red; carbonates are green and mafic volcanic rocks are purple

11/4/2014

Geo327G/386G, U Texas, Austin

NASA/GSFC/MIT/ERSDAC/JAROS
U.S./Japan ASTER Science Team

27

Thermal Infrared Multispectral Scanner (TIMS)

- ⌘ Six spectral bands between 8-12 μm
- ⌘ -2 meter resolution
- ⌘ Processed so hues and tones record differences in quartz, olivine and carbonate contents

11/4/2014

Geo327G/386G, U Texas, Austin

26

Radiometric Resolution

- Smallest detectable difference in radiant energy
 - Analog - high contrast film has higher radiometric res. - more shades of gray resolved
 - Digital - number of (quantization) levels a band can be divided into; what is the possible range of values a pixel may obtain?
 - "7-bit" = 128 levels (Landsat MSS detectors)
 - "8-bit" = 256 levels (Landsat TM)
 - "12-bit" = 4095 levels (AVIRIS)

11/4/2014

Geo327G/386G, U Texas, Austin

27

Temporal Resolution

- Frequency of data collection - time between repeated coverage
 - E.g. Landsat 5, 7 & 8 - 16 days
 - MODIS - 1 to 2 days
 - Higher temporal resolution yields better chance of cloud-free coverage
 - Match frequency with phenomena to be mapped

11/4/2014
